Unique Apps

As review counts exceed approximately 350, the average rating tends to increase.

Apps with fewer reviews often have lower average ratings (around 4.70), suggesting early user feedback may be more critical or polarized.

However, as review counts increase, average ratings also improve — but this trend plateaus around 24,000 reviews, indicating diminishing returns.

This suggests that while a higher number of reviews can correlate with better ratings (possibly due to trust, maturity, or product improvements), there's a ceiling effect beyond which additional reviews don't significantly impact the average rating.
